                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAX52213-74 encode secreted and transmembrane human proteins, and are obtained from cDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. The encoded polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and

                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is one of sixty one nucleic acids encoding novel secreted and transmembrane PRO polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rheumatoid arthritis, multiple sclerosis), infertility, AIDS and diabetes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and gene mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Libiology, including use as hybridization gene mapping

                                                                                                                                                                                                                                                      The present sequence is the coding sequence for a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and

```

ਨੋ ਨੇ שׁ transmembrane PRO polypeptide useful for ivity of a cell, or for treating sports-relate ritis or rheumatoid arthritis. Godowski PJ Goddard A, Wood WI; Gerritsen ME, Watanabe CK, Watanabe ogical activity of osteoarthritis or

The invention relates to an isolated secreted and transmembrane PRO Dolypeptide having 80 % sequence identity to a sequence appearing as ABG9581-ABG95934 or their associated signal peptide. Or a sequence of an extracellular domain of the proteins with their associated signal peptide. Or a sequence of an extracellular domain of the proteins with their associated signal peptide. Also included are the nucleic acids encoding the proteins, vectors, host cells, fusion proteins and antibodies which specifically bind to the proteins. The proteins and antibodies which specifically bind to the proteins. The proteins and determining an A. B. C or D polypeptide, by contacting the sample with a polypeptide designated as B. F. G. H or I (or vice versa) and determining the formation of a A/B. B.F. B/G. CH or D/I polypeptide conjugate in the sample, where the formation of the conjugate is indicative of the presence of an A. B. C or D polypeptide, D/I polypeptide is indicative of the presence of an A. B. C or D polypeptide. C is a PRO1037D polypeptide. E is a PRO300040 polypeptide, D/I polypeptide, D/I sa PRO1037D polypeptide. E is a PRO30040 polypeptide. The E. F. G. C or D polypeptide. The proteins are useful for linking a bioactive molecule expressing a polypeptide designated as A. B. C or D or B. F. G. H or I. The proteins are useful for modulating a biological coling support. The bioactive molecule causes death of the cell. A. B. C, D. E. F. G. H. Or I. or antibodies against them are useful for modulating a biological cativity of a cell expressing a polypeptide designated as A. B. C or D or E. F. G. H. Or I. or antibodies against them are useful for modulating a biological cativity of a cell expressing a polypeptide designated as A. B. C or D or E. F. G. H. Or I. The cell is killed. The proteins are useful for modulating a biological cativity of a cell expressing a polypeptide designated as A. B. C or D or E. F. G. H. Or I. The cell is killed. The protein expressing a polypeptide designated as A. B. C or D or E. F. G. H. O an de 0 0 0 0 0 0 or Ø ϋ Φ

ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, cortivities, and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour cangiogenesis (such as breast carcinoma and liver carcinoma) and wound the aling. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GTGTTGCTTCTCACTTCCATCTGGACCACGAGGCTCCTGGTCCAAGGCTCTTTGCGTGCA

                                                                                                                               Ø
                                                                                             The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritiangina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a coding sequence of the invention

The invention relates to human PRO polypeptides (secreted or transmembrane polypeptides) and the polynucleotides encoding them. The PRO polypeptides and polynucleotides can be used in treating pathological disorders and tumours, in therapeutic treatment of cardiac insufficiency disorders and in therapeutic treatment of disorders involving protein secretion by the pancreas, including diabetes. They can also be used in treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, and skin diseases associated with abnormal keratinocyte differentiation (e.g., psoriases, epithelial cancers such as lung squamous cell carcinoma, epidermoid carcinoma of the vulva and gliomas). The sequences can be used as molecular markers for protein celectrophoresis purposes and can be utilised in protein-protein binding assays, biochemical screening assays, immunoassays and cell-based assays. This sequence represents a human PRO polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         80

```
The present invention relates to the isolation of novel human secreted and transmembrane proteins (PRO polypeptides), and the polynucleotide sequences are useful in sequences encoding them. The polynucleotide sequences are useful in molecular biology, as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide sequences may also be used in preparing PRO polypeptides or knock-out animals which, in turn, are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or their antibodies are useful in preparing a medicament for treating a condition responsive to the polypeptide or antibody, such as cancer, animals or statement and in various diagnostic assays. The researt semience encodes a human PRO polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             40

mbrane protein; PRO; hromosome marker. ein PRO263.

```
The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of a secreted/transmembrane polypeptides, or PRO polypeptides or encoding a PRO protein extracellular domain. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, producing a PRO polypeptide (by culturing the host cell for the expression of the PRO polypeptide, and recovering the PRO polypeptide from the following at least 80% sequence identity to: (an isolated PRO polypeptide (having at least 80% sequence identity to: (an isolated PRO polypeptide (having at least 80% sequence identity to: (an imain acid sequence encoded by a nucleic acid molecule deposited with an ATCC number (detailed in the specification); or (c) an extracellular domain of a PRO polypeptide or to a PRO polypeptide lacking its associated signal a PRO polypeptide or to a produce and a national approach and a sample suspected of containing the polypeptide.

DEACLES OF PRO1868 in a sample suspected of containing the polypeptide or to a produce and produce and processing a PRO245 or PRO1868 in modulating at least one biological activity of a cell expressing a PRO245 or PRO1868 in a sample suspected of containing and processing a processing and the acids may be used for recombinantly expressing those markers. The propertice acids may be used for recombinantly expressing those markers. The PRO pulpeptides are useful in diagnostic assays for PRO, and in affinity purification of PRO from recombinant cell culture or natural affinity purification of PRO from recombinant cell cult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, chromosome markers, in generating probes and in tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                        Ferrara N;

The invention describes an antibody that specifically binds to a PRO polypeptide having a fully defined amino acid sequence given in the specification. The antibody is useful in identifying PRO polypeptides useful for various industrial applications, including pharmaceuticals, diagnostics, biosensors and bioreactors. The antibody is also used for affinity purification of PRO polypeptides from recombinant cell culture or natural sources. The antibody, PRO polypeptide, or its agonists or antagonists, may be used for preparing a medicament for diagnosing or treating a condition responsive to the antibody, PRO polypeptide, or its agonists or antagonists. This sequence encodes a novel human secreted antransmembrane PRO polypeptide

                                                                                                                                                                                                                                                                                                                                 PRO polypeptide, useful for disorders with the aberrant, such as tumor conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             conditions
                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antibody that binds to a secreted or transmembrane protein designated PRO1446 appearing as ABO33941. The protein is one of 84 PRO polypeptides which (along with their encoding nucleic acids) are disclosed in the specification. The methods and compositions of the present invention are useful for the preparation of medicament for the treatment of disorders associated with the aberrant expression or activity of the PRO polypeptide, such as tumour condition and cancer. They can also be used to generate transgenic or knockout animals useful in the development and screening of therapeutically useful reagents. The PRO polypeptides and encoding nucleic acids can be used a molecular weight markers for protein electrophoresis, chromosome identification and tissue typing. The antibodies may be used in various diagnostic, competitive binding and/or immunoprecipitation assays. The

The invention describes novel isolated PRO polypeptides. The PRO
polypeptides or anti-PRO antibodies are useful in preparing a medicament
for treating a condition that is responsive to the PRO polypeptide or
antibody. The PRO nucleotide sequences may be used as hybridisation
probes in chromosome and gene mapping, or in generating antisense RNA and
DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in
assays to identify other proteins or molecules involved in binding
creaction, to generate transgenic animals or knockout animals, which in
turn are useful in the development and screening of therapeutically
useful reagents, for chromosome identification, and tissue typing. The
USE of polypeptides and nucleic acid molecules are also useful in gene
therapy, and as molecular weight markers for protein electrophoresis
purposes. The anti-PRO antibodies may be used in diagnostic assays for
purposes. The affinity purification of PRO from recombinant cell and or preparing the PRO secreted used in diagnostic assays for PRO from recombinant cell encodes a novel human secret human Length 2372; New secreted and transmembrane PRO polypeptides and nucleic molecules encoding the polypeptides, useful in gene therapy a medicament for treating a condition that is responsive to polypeptide or antibody. 0 U; 0 Other; .; ' 524 C; 489 G; 638 T; DB 2372; No. 0; sources. or New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's diseases, organicer, AIDS, injury, disease.

73; 473pp; English Claim 2; Fig The invention relates to an isolated PRO polypeptide having at least 80% amino acid sequence identity to: (a) any one of 61 fully defined amino acid sequences given in the specification (appearing as ABU54347-ABU54407); (b) an amino acid sequence encoded by the nucleotide sequence deposited under American Type Culture Collection (accession numbers listed in the specification); (c) any one of the PRO sequences which lacks its associated signal peptide; (d) an extracellular domain of the PRO polypeptide with its associated signal peptide; or (e) an extracellular domain of the PRO polypeptide which lacks its associated signal peptide. Also include are the nucleic acids encoding the PRO polypeptides, vectors, host cells and anti-PRO antibodies. The PRO polypeptides and nucleic acids are useful in diagnosing or treating enterocolitis, gastrointestinal ulceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as squamous cell carcinoma, Alzheimer's disease, Parkinson's with 80% sednence Parkinson' the

720

disease, amyotrophic lateral sclerosis, inflammatory diseases, e.g. rheumatoid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications, or mutations in general. The polypeptides are also useful for wound repair and associated therapies concerned with re-growth of tissue. The nucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in clasmostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. The present sequence encodes PRO polypeptide ಹ
